No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The antibody is used in cancer therapy. Association of the new antibody with an antigen is favoured over dissociation in vivo and they therefore have longer localisation times at target sites, resulting in a higher concentration of antibodies localised at the target sites. Targeting the antibody to a site in vivo is improved. The concentration of antibody does not need to be too high which reduces side-effects and costs of therapy. The present sequence encodes the heavy chain variable region of a monoclonal antibody having affinity for carcinoembryonic antigen (CEA, a tumour associated antigen), which is used in the exemplification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A nucleic acid sequence (AAT69218) is provided of hybridoma 2E12 sFv. It was obtd. as an HindIII/BgIII fragment by PCR amplification (see also AAT69223-24). It is used in retrovirus vectors such as pLNC-2e12hJgG1hB7-1Tm (see also AAT69216) and pLNC-2e12gJgCcD58cpI (see also AAT69217) that code for novel sFv molecules which have been modified by connecting a transmembrane domain of a cell surface receptor to the antigen binding site of the molecule. This creates artificial ligands that stimulate adhesion between cells and enhance co-stimulatory activity during an immune response against disease. Such vectors can be used for gene therapy of e.g. cancer.

This comprises a fusion between hybridoma 2E12 sFv (see also AAT69218), human IgG1 Fc portion (see also AAT69219) and the transmembrane domain from the CD58 glyco-phosphoinositol (GPI) anchor (see also AAT69221) in vector pLNC. This is an example of novel sFv molecules modified by connecting a transmembrane domain of a cell surface receptor to the antigen binding site of the molecule. This creates artificial ligands that stimulate adhesion between cells and enhance costimulatory activity during an immune response against disease. Such vectors can be used for gene therapy of e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified sFv molecule for mediating adhesion between contains antibody binding site and transmembrane domuseful for enhancing immune responses to disease

This is example of novel sFv molecules that are modified by connecting transmembrane domain of a cell surface receptor to the antigen binding site of the molecule. This creates artificial ligands stimulate adhesion between cells and enhance co-stimulatory activity during an immune response against disease. The vector can be used for gene therapy of e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           A nucleic acid sequence (AAT69216) is provided of a modified sFv encoded by retrovirus vector pLNC-2e12hlgGlhB7-Tm. This comprises a fusion between hybridoma 2E12 sFv (see also AAT69218), human IgG1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modified sFv molecule for mediating adhesion betweentains antibody binding site and transmembrane useful for enhancing immune responses to disease
                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                               The present invention describes an immunoassay (I) for assessing CC processing and/or product quality characteristics of grain from a wheat CC cultivar, by using a monoclonal antibody or fragment specific for one CC member of high molecular weight glutenin subunit pair (HMW-GS). The CC method comprises exposing a wheat grain sample to the antibody, under CC binding conditions, and detecting the binding. The antibody has been CC raised with a preparation comprising the HMW-GS member in a CC substantially denatured form. The immunoassay is useful for assessing CC processing and/or product quality characteristics of grain from a wheat CC cultivar and for discriminating HMW-GS in wheat grains associated with CC superior bread and pasta-making qualities, for identifying preferred CC wheat cultivars in plant breeding. Simple assessment of HMW-GS CC composition and wheat grain quality can be done from small samples of CC grain, meal or flour, e.g. 500mg-10g, making it more economical than CC grain, meal or flour, e.g. 500mg-10g, making it more economical than CC The present sequence encodes a specifically claimed antibody fragment correct correct in the method of the invention.

The conjugate is capable of delivering the antigen to APC and eliciting an immune response to the antigen. The new conjugates are useful as vaccines and are able to elicit an enhanced immune response without the use of an adjuvant. In a specific example, a conjugate was constructed using the murine anti-human class II monoclonal antibody secreted by hybridoma 44H104. The peptide CLTB36 was chosen as antigen; it consists of a tandemly linked T and B cell epitope derived from HIV MN strain. The present sequence encodes the heavy chain variable region which was PCR amplified from 44H104 and used in the preparation of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC confer herbicide resistance activity. Crop plants, such as soybean, CC confer herbicide resistance activity. Crop plants, such as soybean, CC cotton, tobacco, sugarbeet, oilseed rape, canola, flax, sunflower, CC potato, tomato, alfalia, lettuce, maize, wheat, sorghum, rye, bananas, CC barley, oat, turf grass, forage grass, sugar cane, pea, field bean, CC rice, pine, poplar, apple, grape, citrus or nut plants, transformed CC with a herbicide binding protein gene are resistant to the herbicide. CC Hence, weeds can be selectively controlled in a field of the transformed CC crops. The plants are substantially resistant or tolerant to herbicides, CC such as paraquat or diquat, that inhibit photosynthesis by accepting CC electrons from photosystem I thus generating free radicals which cause CC lipid peroxidation or by blocking electron transport in photosystem II. CC The herbicide binding proteins advantageously sequester the herbicide, CC sequestration at the cell surface or in the vacuoles of a treated plant. CC equestration at the cell surface prevents the entry of the herbicide cannot reach its intracellular target and exert any significant cytotoxic effect. The herbicide binding protein consistent of the mobility of the herbicide reaching particularly sensitive corpans. Additionally, tolerant plants can be produced against herbicides or that have more than one target sites.
                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                 The murine anti-PLAP VH gene contains 3 CDRs which are used to reshape the human anti-PLAP VH gene (AAQ11847). The murine anti-PLAP Vk gene (AAQ11846) CDRs were used to reshape the human anti-PLAP gene Vk (AAQ11848). The specific binder for human PLAP contains at least one of the former 3 CDRs and/or at least one of the latter CDRs. The produced antibodies are more readily tolerated when administered to a human patient. Antibody reagents can be used to identify, e.g. by serum testing or imaging, and/or to treat PLAP-producing cancers. Such cancers can occur as, e.g. breast cancer, ovarian cancer and

          antibodies were generated by immunising Balb/C mice with recombined type II phospholipase A2. Spleen cells from the mice were fused with mouse myeloma B3U1 (B3x63Ay8.U1) and the hybridomas obtained were screened for phospholipase A2 inhibitory activity.

Because the antibody acts on the primate and mouse forms of enzyme as well as human it is particularly suitable for preclinical testing.
                                                                                                                                                                                                                                                                                                     W09734634-A1

```
The present sequence encodes a recombinant single chain peptide, 366-scfv. The peptide is an antibody construct comprising the variable regions of the heavy and light chains of an antibody against disialoganglioside (GD2) as a single chain fv fragment (scfv). GD2 occur in many tumours types including neuroblastoma, osteosarcomas and other soft tissue sarcomas, medulloblastomas, high grade astrocytomas, melalloblastomas, high grade astrocytomas, melalloblastomas, high grade astrocytomas, tabelled, preferably with 99m-Tc, for tissue imaging of cells expressing GD2. It can also be used to target delivery of a therapeutic or pre-therapeutic agent, such as a toxin, streptavidin or a pro-drug converting enzyme, to cells expressing GD2. The peptide may further comprise CD8 to facilitate the formation of GD2-targeted lymphocytes.

T cells containing the peptide can also be used to target GD2-producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant single chain anti-disialoganglioside useful to detect tumour cells expressing GD2 and therapeutic agents, e.g. toxins, to such cells

The peptide can be detectably labelled, preferably with 99m Tc, for tissue imaging of cells expressing GD2. It can also be used to target delivery of a therapeutic or pre-therapeutic agent, such as a toxin, streptavidin (e.g. present sequence) or a pro-drug converting enzyme, to cells expressing GD2. The peptide may further comprise CD8 to facilitate the formation of GD2-targeted lymphocytes. T cells containing the peptide can also be used to target GD2-producing tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes a recombinant single chain peptide, 3G6-ScFv-Streptavidin. The peptide is an antibody construct comprising the variable regions of the heavy and light chains of an antibody against disialoganglioside (GD2) as a single chain Fv fragment (ScFv). GD2 occurs in many tumours types including neuroblastoms, osteosarcomas and other contents of the contents of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant single chain anti-disialoganglioside useful to detect tumour cells expressing GD2 and therapeutic agents, e.g. toxins, to such cells
